ONLINE

Dear Yazdan,

Thank you for speaking with Dave regarding our open position for the Software Engineer (Miami · FL).

Goal

As a next step in the process, we'd like to ask you to complete the following take-home project. The goal of this project is to simulate a task you'd be asked to complete if you were hired for the role. The intent of this project is not to be exhaustive, but to demonstrate how you approach a problem, specifically answer a high-level technical question, and how you go about formulating a response that you'd be able to review with the development team such that they can execute on it. You are welcome to make any assumptions you feel are necessary, as long as you are willing to explain them as part of the interview.

Project Definition

Provided Information

The Miami Marlins Baseball Applications team has been tasked with building an application where any member of the organization can get a quick glance of the schedule or results for all of the team's affiliates for a given date on the calendar. To support this functionality, the team has determined it needs to build a service that provides an abstraction layer on Stats API, MLB's official data source, such that the internal front end can hit a single endpoint with a given calendar date.

The following endpoints and information will be necessary to produce the transformed data:
Stats API uses a sport code and team ID tuple to identify a team within a given level of competition

- Major League Baseball Sport Code - 1
- Marlins Team ID - 146

To get the list of affiliates, this endpoint will provide the necessary sport codes and team IDs -
<https://statsapi.mlb.com/api/v1/teams/affiliates?teamIds=146&year=2026>

The Schedule endpoint will return the schedule and results - <https://statsapi.mlb.com/api/v1/schedule?sportId={sportId list, comma separated}&teamId={teamId list, comma separated}> . Appending a date parameter in the YYYY-MM-DD format will show a specific day's schedule and/or results.

Deliverable

The deliverable should be a runnable service that can provide a single endpoint (/schedule) that requests can be issued against to return the data necessary to create a front-end to view the necessary information about a given day's schedule.

Functional Requirements

The endpoint should accept an optional date parameter in the YYYY-MM-DD format for which to provide results. If the date is omitted, the service should use the current date.

The response should contain a list of objects made up of key/value pairs, where the key is an object containing the MLB or affiliate team ID, and the value contains the following information:

- If the team does NOT have a game for that date, an empty object should be returned
- If the team does have a game for that date, the object should contain
 - The team name (eg. "Jupiter Hammerheads")
 - The level of the game (eg. "1A")
 - The opponent team's name (eg. "St. Lucie Mets")
 - The opponent team's MLB parent club, if not an MLB team itself (eg. "Mets")
 - State of the game as shown below

Game State | Information to Include

- Not Started - Game time, opponent, venue, and probable pitchers (if available)
- In Progress - Opponent, venue, current score, inning, outs, runners on base, current pitcher, and batter up-to-bat
- Completed - Final score, winning pitcher, losing pitcher, and save pitcher (if applicable)

Non-Functional Requirements

The submission should include instructions on how to run the project locally on a development machine, including any prerequisites and dependencies that are necessary.

Submission Instructions

Please send your document and/or slides to baseball.applications@marlins.com by **end of day, Monday**,
